

Cyber Security Task 01: Personal Security Audit & Cyber Awareness Assessment

Objective

The purpose of this task is to help students understand basic cybersecurity concepts by assessing their own digital security practices and identifying potential risks.

Cybersecurity starts with securing yourself before securing systems and networks.

Part A: Device Security Assessment

Perform a security assessment of your personal computer or laptop.

Check the following:

System Security

- Operating System
- OS Version
- Is the system updated?
- Antivirus Installed? (Yes/No)
- Firewall Enabled? (Yes/No)

Take screenshots where applicable.

Part B: Password Security Review

Answer the following:

1. What makes a strong password?
2. Why should passwords be unique?
3. What is Multi-Factor Authentication (MFA)?
4. What are the risks of password reuse?

Create a password policy containing at least 5 best practices.

Example:

- Use at least 12 characters
- Use uppercase and lowercase letters
- Include numbers and special characters
- Avoid personal information
- Enable MFA whenever possible

Part C: Online Account Security Check

Review any 3 online accounts (Google, GitHub, LinkedIn, Instagram, etc.)

Check:

- MFA Enabled? (Yes/No)
- Strong Password? (Yes/No)
- Recovery Email Configured? (Yes/No)

Create a table summarizing your findings.

Do NOT share actual passwords.

Part D: Cyber Threat Research

Research and explain the following threats:

1. Phishing
2. Malware
3. Ransomware
4. Social Engineering
5. Data Breach

For each threat include:

- Definition
- Real-world Example
- Prevention Methods

Use your own words.

Part E: Cyber Security Awareness Poster

Create a simple awareness poster on any one topic:

- Phishing Awareness
- Strong Passwords
- Safe Internet Usage
- Social Engineering Awareness
- Multi-Factor Authentication

Tools you may use:

- Canva

- PowerPoint
 - Photoshop
 - Figma
-

Part F: Security Reflection

Answer the following:

1. What cybersecurity risks did you identify in your own digital habits?
2. What security improvements will you implement immediately?
3. Why is cybersecurity important in today's world?

Write at least 200–300 words.

Documentation

Create a folder named:

CyberSecurity_Task_01_YourName

Inside the folder include:

- Device Security Assessment
- Password Policy
- Account Security Review
- Threat Research
- Awareness Poster
- Reflection Report
- README.md

Upload everything to GitHub.

Submission

The purpose of this task is learning and self-assessment.

This is not a marks-based task.

Submit your updated GitHub repository link through the Sunday Submission Form before the weekly deadline.

Continue maintaining all internship tasks in the same repository using separate folders.

Topics to Study Before the Next Session

Please spend some time learning:

- CIA Triad (Confidentiality, Integrity, Availability)
- Types of Cyber Threats
- Malware Basics
- Phishing Attacks
- Social Engineering
- Authentication vs Authorization
- Password Security
- Multi-Factor Authentication (MFA)
- Cyber Hygiene Best Practices

Recommended Study Time:

30–45 minutes per day.

Remember: Cybersecurity is not only about tools and hacking. It begins with understanding risks, developing secure habits, and protecting information responsibly.
